

AGENTICCORE FOREX PLUS - TIER 2

CURRENT BUILD, OPERATION, AND COMPLETION CHECKLIST

Prepared: 20 August 2026

PURPOSE

Tier 2 is the stable AgenticCore Forex Plus framework currently intended for the FBS MT5 environment. It is a practical intraday multi-pair framework, not the future Premium Tier 1 research system. Tier 2 should be frozen after its final safety checks.

STATUS LEGEND

[CURRENT] Implemented in the reviewed Tier 2 code/configuration.

[PARTIAL] Present, but still needs a production-strength hardening or validation step.

[NEXT] Missing or not yet fully verified and should be completed before calling Tier 2 completely finished.

1. OPERATING MODEL

[CURRENT] The Tier 2 process starts a trading manager, a portfolio monitor, and an optional dedicated Telegram polling task.

[CURRENT] The manager scans every 15 minutes.

[CURRENT] The portfolio monitor refreshes account and positions every 15 seconds.

[CURRENT] A scan runs market data, technical analysis, session intelligence, news filtering, trade memory adjustments, signal generation, account/position refresh, entry guards, risk approval, and execution.

[CURRENT] Open positions are monitored independently of the entry scan.

[CURRENT] The framework supports auto, semi, and signal modes:

- auto: approved signals are executed automatically.
- semi: the best approved signal waits for Telegram /approve or /reject.
- signal: approved signals are reported but not executed.

[CURRENT] A Replit guard prevents accidental live execution in the Replit editing environment unless explicitly overridden. The live worker is intended for laptop/VPS.

2. CURRENT BROKER AND SYMBOL SETUP

[CURRENT] The reviewed Tier 2 configuration is set for FBS with no symbol suffix.

[CURRENT] The active configured instruments are:

EURUSD, GBPUSD, USDJPY, USDCHF, AUDUSD, USDCAD, EURGBP, E
CADCHF, NZDAUD, XAUUSD, XAGUSD.

[CURRENT] Broker suffix support exists. JustMarkets symbols can use the .m suffix.

[CURRENT] Filling mode supports auto, FOK, IOC, and RETURN.

[CURRENT] The framework uses the MT5 Python interface and a MockBridge in dev mode.

[PARTIAL] The current MT5 bridge connects to an already-running terminal and does not yet explicitly select an MT5 terminal path or verify every account identity field before trading. This is acceptable for the current isolated FBS worker only after the VPS checks are completed.

3. MARKET DATA AND TECHNICAL ANALYSIS

[CURRENT] OHLCV data is requested for each configured symbol on M15, H1, and H4.

[CURRENT] The default history request is 200 bars per timeframe.

[CURRENT] Broker suffixes are applied centrally before symbols are passed to MT5.

[CURRENT] Each timeframe calculates:

- RSI
- MACD line, signal, and histogram
- EMA20, EMA50, and EMA200
- Bollinger upper, middle, and lower bands
- ATR

- Recent support and resistance
- UP, DOWN, or SIDEWAYS trend state
- Six bullish and six bearish rule signals

[CURRENT] M15 is the primary snapshot. H1 and H4 are used for confluence.

[CURRENT] Full agreement receives a +25 confidence bonus. Partial agreement receives a +10 bonus. Confidence is capped at 95.

[PARTIAL] There is no full stale-data, spread-quality, liquidity, anomaly, or cross-provider data-quality gate yet. Those belong in the completion checklist and Premium architecture.

4. SESSION INTELLIGENCE

[CURRENT] UTC session intelligence detects Sydney, Tokyo, London, and New York.

[CURRENT] London/New York overlap receives a +15 confidence modifier.

[CURRENT] Tokyo/London overlap receives half of the overlap bonus.

[CURRENT] An active single session has no modifier.

[CURRENT] No active major session applies a -20 dead-zone modifier and reports AVOID.

[CURRENT] Telegram /session reports active sessions, overlap, modifier, and recommendation.

[PARTIAL] Session intelligence currently modifies confidence; it is not by itself the hard Dubai entry gate. The separate TradingGuard is the hard new-entry gate.

5. NEWS AND EVENT FILTER

[CURRENT] Tier 2 reads a ForexFactory calendar RSS/XML feed.

[CURRENT] High-impact keyword matching covers items such as NFP, FOMC, Fed, CPI, GDP, rate decisions, employment, inflation, ECB, BOE, BOJ, and RBA.

[CURRENT] Events within approximately 60 minutes of the current time can block affected currency pairs.

[CURRENT] Currency-to-pair mapping also covers gold, silver, and oil through USD.

[PARTIAL] This is a lightweight keyword/feed filter, not a licensed economic-calendar system. It can fail open when the feed is unavailable. Premium will replace it with normalized, timestamped, provider-backed event data and explicit blackout/stabilization rules.

6. SIGNAL GENERATION

[CURRENT] Base scoring compares six bullish and six bearish technical conditions.

[CURRENT] A trend-aligned signal receives a base trend bonus.

[CURRENT] Overbought/oversold conditions reduce confidence in the corresponding direction when the setup is stretched.

[CURRENT] MTF confluence, session modifier, and pair trade-memory adjustment are added.

[CURRENT] Signals below the configured minimum confidence are converted to HOLD.

[CURRENT] The reviewed Tier 2 configuration uses a 65% minimum confidence.

[CURRENT] Gemini can validate borderline signals in the 40% to 70% range when the Gemini key and feature flag are available.

[CURRENT] If the LLM call fails, the code falls back to the rule-based direction and confidence rather than stopping the whole scan.

[PARTIAL] The LLM fallback is operationally resilient but is not yet calibrated against realized outcomes. Confidence remains a heuristic score, not measured probability.

7. POSITION CAPACITY AND RISK

[CURRENT] Normal capacity is five simultaneous open positions.

[CURRENT] Absolute capacity is seven simultaneous open positions.

[CURRENT] Positions 6 and 7 require confidence strictly above 80%.

[CURRENT] A pair with an existing open position is rejected by the capacity guard.

[CURRENT] Capacity is reusable after a position closes; it is not a daily quota.

[CURRENT] The default global fixed lot is 0.05. XAUUSD and XAGUSD have 0.01 overrides.

[CURRENT] Risk-based sizing remains available when fixed lot is set to null.

[CURRENT] Default stop-loss is 15 USD.

[CURRENT] Default currency-pair take-profit is 20 USD.

[CURRENT] XAUUSD and XAGUSD use 30 USD TP overrides.

[CURRENT] The configuration includes a 1% risk-per-trade setting, but fixed lot sizing takes priority when a fixed lot is configured.

[PARTIAL] Risk uses static pip-value tables and fixed lot rules; it does not yet calculate broker contract specifications, total correlated exposure, margin stress, or portfolio risk from live symbol metadata.

8. DUBAI SESSION AND DAILY LOCKS

[CURRENT] New entries are allowed from 05:00 through 23:29 Asia/Dubai.

[CURRENT] New entries are blocked at or after 23:30.

[CURRENT] Existing positions continue to be monitored and managed after the cutoff.

[CURRENT] The session is 05:00 Dubai to the next 05:00 Dubai.

[CURRENT] The baseline is persisted in trading_guard_state.json.

[CURRENT] The current session equity P&L is compared to that baseline.

[CURRENT] New entries lock at -15% session loss or +20% session profit.

[CURRENT] If the current session baseline cannot be trusted, new entries remain blocked until the next session boundary while existing positions remain managed.

[PARTIAL] The current implementation should be verified after restart, VPS reboot, late launch, and boundary transitions before being marked final.

[NEXT] Add explicit Telegram visibility for baseline, session key, lock state, and reason so the operator can verify the guard without reading files.

9. EXECUTION

[CURRENT] The execution agent fetches a live bid/ask immediately before order creation.

[CURRENT] SL/TP are calculated from the live execution tick, not a stale candle close.

[CURRENT] Buy orders use ask entry and sell orders use bid entry.

[CURRENT] Filling modes can be tried according to configuration.

[CURRENT] Every successful open can send Telegram details including direction, symbol, entry, lot, SL, TP, confidence, and summary.

[CURRENT] Close actions send Telegram P&L messages and update trade memory.

[CURRENT] closeall is available as an emergency Telegram command.

[PARTIAL] The bridge currently falls back to MockBridge when MT5 connection fails.

That is useful for development but is unsafe for a live worker if the fallback is not explicitly visible and fail-closed. Live deployment should stop or alarm instead.

[NEXT] Add explicit terminal path, account/server verification, unique worker identity, idempotent order handling, broker result reconciliation, and live-mode fail-closed behavior.

10. PROFIT LOCK AND PORTFOLIO MONITOR

[CURRENT] The monitor refreshes positions every 15 seconds.

[CURRENT] It reconciles positions missing from the local snapshot with broker history.

[CURRENT] Broker-confirmed close P&L is recorded and reported.

[CURRENT] At 65% progress from entry to the original TP, the stop locks 35% of that original TP distance.

[CURRENT] The original TP remains unchanged.

[CURRENT] The lock is applied only in the favorable direction and once per ticket.

[CURRENT] The live executable price side is used: bid for BUY and ask for SELL.

[CURRENT] A combined floating basket target of 30 USD can close all active positions.

[CURRENT] Daily, floating, basket, and total exposure summaries are available.

[PARTIAL] Tier 2 currently has one principal profit-lock behavior. It does not yet have Premium's multi-level exceptional-trend, exhaustion, or thesis-invalidation management.

[NEXT] Verify that the basket close policy is intentional for the live FBS account, because it can close otherwise healthy individual trades.

11. TRADE MEMORY AND REPORTING

[CURRENT] Recent per-pair outcomes are persisted in logs/trade_memory.json.

[CURRENT] After at least five trades, the last 20 results can create:

- +10 confidence adjustment at or above 60% win rate.

- -15 confidence adjustment at or below 35% win rate.

[CURRENT] JSONL trade logs record trade time, pair, direction, lot, ticket, price,

SL, TP, profit, status, and signal summary.

[CURRENT] Telegram supports today, week, and all-time reports.

[CURRENT] Daily reports are scheduled for 23:45 Dubai time.

[CURRENT] Weekly reports are sent on Monday after the reporting time.

[CURRENT] Telegram supports /memory, /report, /backtest, and /optimize.

[PARTIAL] Memory stores results and adjusts confidence, but it does not yet store the full feature snapshot, regime, event state, MFE/MAE, rejection reason, or exit classification needed for research-grade learning.

12. TELEGRAM CONTROL SURFACE

[CURRENT] Admin authorization is checked against the configured admin chat ID.

[CURRENT] Main commands include:

/status, /report, /session, /memory, /broker

/stop, /resume, /closeall

/mode auto|semi|signal

/reload

/settp, /setsl, /setrisk, /setconfidence, /pairs

/maxpositions, /backtest, /optimize

/approve, /reject

[CURRENT] Telegram polling has conflict retry handling and drops stale webhooks.

[CURRENT] Tier 2 uses a dedicated Telegram token/environment variable separate from the old Tier 1 bot.

[PARTIAL] Configuration changes are not yet a complete audited configuration management system. Sensitive, high-impact changes should gain confirmation, bounds, audit logging, and persistent operator visibility.

[NEXT] Add heartbeat, MT5 disconnect, stale-data, failed-order, session-lock, and unexpected-process-stop alerts.

13. CURRENT TIER 2 COMPLETION CHECKLIST

[] Verify VPS account, server, and broker identity from Telegram and logs.

[] Verify MT5 AutoTrading and terminal state.

[] Replace any credential values in configuration files with VPS environment secrets.

[] Rotate credentials if any were ever exposed outside the secret manager.

[] Confirm no live fallback to MockBridge after an MT5 failure.

[] Confirm the 05:00 baseline is captured and survives restart.

[] Confirm late launch blocks entries until the next 05:00 reset.

[] Confirm 23:30 blocks only new entries.

[] Test -15% and +20% locks with simulated state.

[] Test position slots 1-5, then confidence strictly above 80% for slots 6-7.

[] Test capacity reuse after a position closes.

[] Test live tick SL/TP calculation on a symbol with the broker's real contract.

[] Test profit lock at exactly 65%, including BUY and SELL.

[] Verify original TP remains unchanged after the lock.

[] Decide and document whether the 30 USD basket close remains enabled.

[] Confirm Telegram /status, /session, /report, /memory, /stop, /resume, /closeall.

[] Confirm one and only one polling process for this bot.

[] Confirm daily and weekly reports.

[] Back up logs and state before the next operating session.

[] Freeze Tier 2 after these checks; future improvements belong in Premium unless they are critical safety fixes.

14. TIER 2 BOUNDARY

Tier 2 is a stable, rules-based plus limited-LLM intraday framework. It offers multi-timeframe technical confluence, session intelligence, event blocking, trade memory, fixed/risk-based sizing, position capacity, Telegram control, MT5 execution, profit locking, basket protection, and reporting. It does not yet offer Premium's research-grade provider adapters, calibrated probability, correlation portfolio model, specialist gold/silver/oil modules, structured trade memory, or full out-of-sample validation system.
