

AgenticCore Forex Plus Tier 2

Stable intraday framework - complete capabilities, current status, and remaining work

Executive status

This report is a current-state project record prepared from the Replit source tree, existing specifications, test results, and the latest VPS status. It separates features that are implemented in code from features that are planned, partially validated, or still require a controlled VPS environment.

Prepared: 25 August 2026 (Asia/Dubai)
Source of truth for code: Replit workspace
VPS status: only what was visible from the submitted Windows terminal output is treated as verified

Important: this is a software and deployment status report, not a promise of trading profits. Live execution remains subject to market conditions.

AgenticCore Forex Plus - Tier 2

1. Project purpose and boundary

CURRENT POSITION - Tier 2 is the stable, practical intraday Forex framework. It is separate from the future Premium Tier 1 research system and should be frozen after operational safety validation.

The reviewed configuration is built around MT5 and supports FBS as the current baseline, with broker suffix support for JustMarkets. It has auto, semi, and signal modes. The Replit runtime is protected from accidental live trading; the intended live runtime is a laptop or Windows VPS.

The strategy uses M15 as the primary scan with H1/H4 confluence, session intelligence, deterministic risk controls, Telegram operations, trade memory, and broker-confirmed close accounting.

2. Features and capabilities built

Operating model and broker support

- Manager process scans on a 15-minute interval.
- Independent portfolio monitor refreshes positions and account state approximately every 15 seconds.
- Optional dedicated Telegram polling task uses a separate Tier 2 bot token.
- Auto mode can execute approved entries; semi mode waits for approval; signal mode reports without execution.
- Replit guard prevents accidental live operation inside the editing environment.
- MT5 bridge supports broker symbols, suffix mapping, filling modes, account/position/history access, and mock bridge testing.
- Configured coverage includes EURUSD, GBPUSD, USDJPY, USDCHF, AUDUSD, USDCAD, EURGBP, CADCHF, NZDAUD, XAUUSD, and XAGUSD.

Market analysis

- Retrieves broker candles for M15, H1, and H4.
- Calculates RSI, MACD, EMA20/50/200, Bollinger Bands, ATR, support/resistance, and trend state.
- Uses completed candles for signal decisions.
- Applies multi-timeframe confluence and bounded confidence scoring.
- Includes session intelligence for Sydney, Tokyo, London, New York, overlaps, and dead-zone avoidance.
- Includes event/news sentiment as advisory signal context, with Gemini commentary kept advisory rather than authoritative.
- Adds completed-candle tick-volume classification and low-volume gates.
- Treats Gold and Silver with asset-aware volume behavior so metals are not incorrectly rejected by forex volume assumptions.
- Applies confidence calibration adjustments within bounded limits and caps exceptional confidence.

Risk and trading guards

- Deterministic entry and risk checks run before execution.
- Dubai session guard uses a durable 05:00 baseline and fail-closed behavior when the baseline cannot be trusted.
- New entries stop at the configured session boundary while existing positions remain managed.
- Session profit target is configurable and currently set to 5% in the reviewed configuration.
- Daily/session locks, position capacity, confidence thresholds, exposure checks, and broker constraints are enforced.
- Profit-lock policy preserves the original TP and protects 35% of its distance once price reaches 65% progress.

are supported.

- A dedicated token prevents conflict with the older Tier 1 bot.

Testing and completed safety updates

- Completed-candle volume classification, low-volume gates, Gold/Silver handling, bounded confidence, advisory AI, durable Telegram outbox, close-ledger lifecycle, broker-confirmed accounting, partial-exit aggregation, session target behavior, MT5 identity checks, and protected settings were implemented.
- Replit validation: 24 Tier 2 tests passed.
- Compilation validation passed.
- The source tree is saved in artifacts/agentcore-forex/v2.

3. Current status

CURRENT POSITION - The code and reviewed safety changes are complete enough for

controlled signal-only validation. The Replit worker is intentionally not the live Forex runtime and exits under the Replit guard. The Windows laptop/VPS copy must be validated separately.

The reviewed config currently has mode auto and dev_mode false, so launching that exact configuration on a real MT5 machine would be live operation. It should not be used as the first validation step.

No claim is made here that the current Windows deployment has every latest file until its manifest and hashes are checked against Replit.

4. What remains before Tier 2 is called fully operational

Required VPS/laptop validation

- Run signal-only mode for at least one complete scan cycle.
- Verify MT5 broker, server, account, terminal identity, AutoTrading state, symbols, contract data, and filling behavior.
- Confirm no MockBridge fallback can occur after a real MT5 failure.
- Confirm protected environment variables are present and no credentials are in configuration files.
- Confirm the durable 05:00 baseline survives restart and blocks late launches correctly.
- Simulate and verify the configured loss/profit locks, position slots, capacity reuse, and session boundary.
- Verify live tick-based SL/TP calculation on actual broker contracts.
- Verify BUY and SELL profit lock exactly at 65%, with original TP unchanged.
- Confirm Telegram status, session, report, memory, stop, resume, closeall, and one-process polling behavior.
- Back up state and logs before the first operating session.

Remaining safety and reliability work

- Add heartbeat, MT5 disconnect, stale-data, failed-order, session-lock, and unexpected-process-stop alerts.
- Complete broker lot-size/volume validation so the bot never submits an unexpected lot size.
- Confirm whether the basket-close policy should remain enabled for the live account; document the decision.
- Harden configuration changes with confirmation, bounds, audit logging, and persistent operator visibility.
- Improve stale-data, spread, liquidity, anomaly, and cross-provider quality gates where needed.

Remaining research-grade capabilities intentionally outside Tier 2

- Full feature snapshots, regime, event state, MFE/MAE, rejection reasons, and exit classifications in trade memory.
- Calibrated probability and out-of-sample validation rather than fixed score

that, Tier 2 should be frozen and future improvements should move to Premium.
